

Zoom custom connect doesn't work

I want to solve the issue of the Zoom custom connector with JWT.

My Zoom JWT app works with Python but my Power Automate custom connector doesn't work.

Please help me.

- I confirm that my Zoom JWT app works with using Python as below.

```
import http.client
conn = http.client.HTTPSConnection("api.zoom.us")
headers = {
    'authorization': "Bearer {deleted}",
    'content-type': "application/json"
}
conn.request("GET", "/v2/users?status=active&page_size=30&page_number=1",
headers=headers)
res = conn.getresponse()
data = res.read()
# print(data.decode("utf-8"))

with open('zoomJWT.txt', mode='w') as f:
    f.write(data.decode("utf-8"))
```

- I built the Power Automate Custom connector as below but it failed: error code: '124'.

General information

Connector Name

1. General > 2. Security > 3. Definition > 4. Code (Preview) > 5. Test Swagger Editor Update connector

General information

Add an icon and short description to your custom connector. Your host and base URL will be automatically generated from the swagger file.

General information

Upload connector icon
Supported file formats are PNG and JPG. (< 1MB)

Actions (1)

Actions determine the operations that users can perform. Actions can be used to read, create, update or delete resources in the underlying connector.

LISTUSER

New action

Triggers (0)

Triggers read data in from your connector. A trigger focuses on a particular event that happens, say a new Contact or Order being created and provides the relevant data so that users can take action on that event.

New trigger

General

Summary [Learn more](#)

List User

Description [Learn more](#)

Operation ID *

This is the unique string used to identify the operation.

LISTUSER

Visibility [Learn more](#)

none advanced internal important

References (0)

References are reusable parameters used by both actions and triggers.

Policies (0)

Policies are used to change the behavior of actions and triggers through configuration. You can use one or more policies from a set of predefined templates.

New policy

Request

It defines the pre-requirements needed in order to make a request. Describes a single operation parameter. A unique parameter is defined by a combination of a name and location.

Request [+ Import from sample](#)

Verb *

The verb describes the operations available on a single path.

GET

URL *

This is the request URL.

https://api.zoom.us/v2/users

Path

Path is used together with Path Templating, where the parameter value is actually part of the operation's URL.

Query

Query parameters are appended to the URL. For example, in /items?id=###, the query parameter is id.

Headers

These are custom headers that are part of the request.

Body

The body is the payload that's appended to the HTTP request. There can only be one body parameter.
